VITAL STATISTICS OF CALIFORNIA

1987

George Deukmejian
Governor
State of California

THE VITAL STATISTICS SYSTEM IN CALIFORNIA

STATE REGISTRAR: DIRECTOR OF CALIFORNIA STATE DEPARTMENT OF HEALTH SERVICES

OFFICE OF STATE REGISTRAR: The State Registrar's functions are performed by the Office of State Registrar, which

- Maintains a permanent public record of each birth, death, marriage, and marriage dissolution which has occurred in California since 1905.
- Provides certified copies of California vital records or searches the permanent central registry to verify the occurrence of vital events in California.
- Prepares and maintains computer files of state birth, death, marriage, and divorce data and monitors these files for data quality.
- Offers tables and computer tapes from the state vital statistics files to public and private organizations and to individuals requesting the data for research and planning and provides consultation to the users of these data.
- Prepares and periodically publishes statistical analyses and summaries of vital statistics for use by the Department of Health Services, other agencies, and the public. The data are used in medical and social sciences, public health and health demographics, human services planning, population estimation and projection, and economic forecasting.
- Builds and continues cooperative relationships with federal, state, and local agencies including the National Center for Health Statistics, which collect, maintain, and use vital records/statistics.
- Develops forms, standards, and guidelines for registration of all vital events occurring in the State of California.
- Directs and monitors the state-delegated functions of approximately 180 local offices which register California's vital events in order to assure statewide compliance with the statutory mandate for uniform application of registration laws, policies, and procedures.

VITAL STATISTICS OF CALIFORNIA

Ann Rubesky

Data Processing

Data Systems Branch Programming
Connie Bancroft
Mauricio Delcastillo

Additionally, the Health Demographics Section gratefully acknowledges the cooperation and assistance of: Beth Berkov, Arthur Chung, Kae Elicker, Wanda Kramer, Brian McNamara, Roger Smith, and the Demographic Research Unit, Department of Finance, and the Staff of the Vital Statistics Program and Operations Sections.

PREFACE

One of the most fundamental and important functions of the California Department of Health Services is the compilation and enumeration of data on the State's births, deaths and other vital events. Vital statistics information is essential for public health surveillance, health care services planning, and health policy decision making. Such information is also important for other governmental agencies, the business community, and numerous other entities. Thus, we are pleased to present Vital Statistics of California, 1987, the latest report on California's vital events.

The primary sources of data used in preparing this report were certificates of live birth, death and fetal death which occurred in California during 1987 and which were registered with the Department. For all practical purposes, this includes all such events. Not included in this report, but available from the Office of the State Registrar, are data on marriages, legal separations, judgments of nullity, and dissolutions of marriage.

The vital statistic rates that are presented in this report, and which use population as a denominator, were calculated using the latest California population data. These data were prepared by the Demographic Research Unit of the Department of Finance. Since this report uses the most recent data available, some rates may differ slightly from previously published rates. For the reader's convenience, state and county population data are presented so that, if desired, more specific rates or independent calculation of rates may be performed.

Also, to assist users of this document, a description of California's vital statistics registration system, along with information on how to interpret and analyze the data, is presented in Chapter 6. Likewise, Chapter 7 provides definitions of the rates and ratios used throughout the report.

This year's report contains several new tables: Table 1-5 presents life-expectancy data for Californians; Table 2-34 compares the percent of live births delivered by cesarean section in California and the United States from 1970-1987; Table 2-35 presents the number and percent of county live births delivered by cesarean section in 1987; Tables 5-1 A-D enumerate the ten leading causes of death by race/ethnicity for 1986 and 1987; and Tables 5-2 A-D which delineate the five leading causes of death for 1987 by race/ethnicity, sex and age.

AIDS (Acquired Immune Deficiency Syndrome) was among the five leading causes of death by sex and age (Table 5-2) for the first time in 1987, due in part to new ICD coding categories for HIV infection. AIDS was the second leading cause of death for males ages 25-44; it was fifth for males ages 15-24 and 45-54.

We continue to be particularly concerned by mortality resulting from unintentional injuries and homicide. It is especially disturbing that homicide was the leading cause of death in California for Black males and females ages 15-34 despite an overall decline in homicides of 4.5 percent in 1987.

We are gratified by the continued progress that is being made in extending overall life expectancy in California. The reduction in death rates for chronic liver disease and cirrhosis, unintentional injuries, and suicide, are also encouraging. However, we are concerned about the continued toll and, indeed, increased mortality resulting from AIDS.

Regrettably, tobacco abuse continues to be a major cause of death in California and remains the single most preventable cause of illness and death in the State.

Overall, though, as the data provided here show, California's population continues to grow and California continues to be one of the healthiest places in the U.S. to live.

Kenneth W. Kizer, M.D., M.P.H.
Director
California Department of Health Services
and
State Registrar

* Note: The section on Race/Ethnicity should be read before beginning analysis of data by race.

NOTE: Recent Departmental studies, which linked information from birth and infant death certificates, showed that a significant number of Hispanic and American Indian infant deaths were incorrectly reported as White. The degree to which this incorrect race/ethnic reporting for infant deaths occurred for other age groups is unknown. Therefore, death data for Hispanics, American Indians and other detailed race/ethnicity groups should be used with caution. (See Chapter 6, p. 247-249 for more detail.)

HIGHLIGHTS

POPULATION..... California had an estimated population in 1987 of 27,662,955 persons. The population density was 176.7 persons per square mile of land area, an increase of 38.0 percent over the 1970 population density of 128.0 persons (Table 1-3).

- Life Expectancy..... Table 1-5, entitled "Life Expectancy at Birth and Average Number of Years of Life Remaining at Age 65 By Selected Years and Sex, California, 1919-1921, 1929-1931, 1939-1941, 1950, 1960, 1970, 1980, and 1987", is a new addition to the Vital Statistics of California report.

  Life expectancy for females born in 1987 was 79.3 years, nearly seven years longer than life expectancy for males (72.4 years). This difference was less than the difference in 1970, when the female life expectancy was greater than seven years (7.3 years).

LIVE BIRTHS..... The number of live births to California residents reached 503,376 in 1987, an increase of 21,471 or 4.5 percent over 1986. This compares to a 2.4 percent increase from 1985 to 1986. It was the fourteenth consecutive annual rise in births (Table 1-1).

California's 1987 crude birth rate of 18.2 live births per 1,000 population was an increase of 1.7 percent over the 1986 rate of 17.9. This is the highest rate since 1965 when it was 19.2 (Table 1-1).

- **General Fertility Rate...** The 1987 General Fertility Rate of 76.6 live births per 1,000 women ages 15-44 was the highest general fertility rate in California since 1970, when it was 84.7. The 1987 rate was 2.4 percent higher than the 1986 rate of 74.8 (Table 2-2).

  California's 1987 general fertility rate of 76.6 was 15.9 percent higher than the national rate of 66.1. This was the twelfth consecutive year that the general fertility rate for California surpassed that of the United States (Table 2-2).

  Kings County posted the highest general fertility rate in 1987, 106.5, and Marin County the lowest at 46.9 (Table 2-5).

- **Women of Childbearing Age.....** The median age of California women of childbearing age (15-44) in 1987 was 30.2 years compared to 29.6 years for the United States (Table 2-1).

  In 1980, the median age of California women of childbearing age was 28.0 and the median age for the United States was 27.8.

- **Age-Specific Birth Rates.....** In 1987, California's age-specific live birth rates increased for women in each age group, with the exception of under 15, which remained the same (Table 2-4).

  Since 1981, the live birth rate for females under 15 has remained essentially the same, varying between 1.0 and 1.1 live births per 1,000 females ages 10 to 14 years. The rate in 1987 was the same as in 1986, 1.1.

- **Age-Specific Birth Rates (continued).....** The 15-19 year-old live birth rate, which showed a downward trend from 1982-84, has increased for the third consecutive year. The 1987 rate was 55.2 live births per 1,000 women ages 15 to 19 years, a gain of 3.8 percent over 1986. In 1986 the rate increased 1.3 percent, from 52.5 to 53.2 (Table 2-4).

  The same trend was apparent for 20-24 year-olds. After a two year decrease from 1982-84, the live birth rate has risen for the third year in a row; from 121.8 in 1986 to 123.7 in 1987, a 1.6 percent increase, compared to a 0.5 percent increase from 1985 to 1986 (Table 2-4).

  For women, ages 25-29, the live birth rate also continued to rise. In 1987 the live birth rate was 134.3 compared to 128.5 in 1986, a 4.5 percent difference; from 1985 to 1986 the percent increase was 2.0. This is the ninth consecutive year the birth rate has increased for this age group (Table 2-4).

  The live birth rate for 30-34 year-olds went from 81.2 in 1986, to 85.0 in 1987, up 4.7 percent. That is the highest birth rate among this age group since 1964 when it was 90.7 (Table 2-4).

  The 1987 live birth rate for 35-39 year-olds rose from 33.0 to 35.4, up 7.3 percent. The rate for this age group has consistently increased during the last twelve years (Table 2-4).

  Since 1975, the live birth rate for mothers in their thirties has risen dramatically. The 1987 rate of 85.0 for 30-34 year-olds was an

- **Age-Specific Birth Rates (continued).....** increase of 51.8 percent over the 1975 rate of 56.0. The rate for 35-39 year-olds increased by 73.5 percent from 20.4 in 1975 to 35.4 in 1987 (Table 2-4).

  For mothers ages 40 to 44, the live birth rate was 7.1 in 1987, a 17 year high and a 10.9 percent increase over the 1986 rate of 6.4. The 1987 rate of 0.5 for mothers ages 45 and over was the highest since 1967. The 1987 rate of 0.5 is a 25 percent increase over the 1986 rate of 0.4 (Table 2-4).

- **Low Birthweight.....** Six percent of births to California residents were low birthweight (under 2500 grams). Slightly over half of those low birthweight births were premature (37 weeks or less gestation). Less than two percent (1.8 percent) of all mothers received no prenatal care; of those mothers, 15.3 percent had low birthweight babies. Most mothers (74.8 percent) had prenatal care starting in the first trimester; 5.5 percent of those mothers had low birthweight babies (Table 2-23).

- **Birth Order.....** California's birth rates increased for all birth orders from 1986 to 1987. The rates for the first, second, third, fourth and fifth or higher live birth orders increased by 2.0, 1.7, 4.2, 6.1, and 5.4 percent, respectively (Table 2-4).

  First live birth order rates increased over those in 1986 for women in each age group from 15 to 44 years. The 40-44 year-old age group posted the highest increase, 20.0 percent, followed by mothers ages 35-39 (13.0 percent). Among 35-39 year-olds the rate for first births increased by 200 percent from 1970 to 1987 (Table 2-4).

- Birth Order (continued)..... Second live birth order rates increased for mothers ages 15 to 44 (Table 2-4).

  Third live birth order rates increased for mothers ages 15 to 44 (Table 2-4).

  Fourth live birth order rates increased for mothers ages 20 to 45 and over and remained the same for the under 15 and 15-19 age groups (Table 2-4).

  Women in their 20's and 30's showed an increase in the fifth or more live birth order rate; 40-44 year-olds experienced a slight decrease in the fifth or more live birth order rate; and rates for the under 15, 15-19 and, 45 and over age groups remained the same (Table 2-4).

- Race/Ethnicity..... Of the 503,376 resident live births in 1987, 392,694 were White, 50,523 were Black, 57,797 were of other race/ethnicities and 2,362 were not stated, as detailed in Table 2-9. In terms of percentages, 78.0 percent of the live births were White, 10.0 percent Black, 2.8 percent Filipino, 1.8 percent Chinese, 1.2 percent Other Asians, 1.1 percent Vietnamese, 1.0 percent American Indian, 0.9 percent Japanese, 0.8 percent Korean, 0.7 percent were Pacific Islander, 0.4 percent East Indian, 0.1 percent Other race/ethnicities, Eskimo/Aleut less than 0.01 percent and 0.5 percent not stated.

  Spanish/Hispanic origin births in 1987 numbered 166,051 and comprised 33.0 percent of California's resident live births. Of these Spanish/Hispanic births, 86.4 percent were Mexican, 0.9 percent were Puerto Rican, 0.5 percent were Cuban, and 12.2 percent were of other Spanish/Hispanic origin (Tables 2-9 and 2-10).

- **Marital Status.....** An estimated 27.1 percent of all live births in 1987 were to unmarried women. Among Black mothers 60.7 percent of the live births were nonmarital, compared to White-Non-Hispanic, 18.2 and White-Hispanics, 35.8 percent (Tables 2-31 and 2-33).

  In 1987, for women under age 20, an estimated 63.0 percent of the live births were nonmarital. The percentage of teen nonmarital live births was 87.4 for Blacks, 60.6 for White-Hispanic and 57.5 for White-Non-Hispanic (Table 2-32).

- **Cesarean Sections.....** Table 2-34, entitled "Percent of Live Births Delivered by Cesarean Section, California and United States, 1970-1987", and Table 2-35, "Number and Percent of Live Births Delivered by Cesarean Section, California Counties, 1987", are new additions to the Vital Statistics of California report.

  Of the 503,376 live births in 1987, 118,463 were delivered by cesarean section.

  The percent of resident cesarean births in California has risen from 6.9 in 1970 to nearly one-fourth (23.5) of all live births in 1987. In the United States, cesarean deliveries rose from 5.5 percent in 1970 to 24.4 percent in 1987.

  The 2.2 percent increase in California from 1986 to 1987 was the lowest since 1981.

  Cesarean deliveries ranged from a high of 32.5 percent in Imperial County to a low of 7.9 percent of all deliveries in Modoc County.

FETAL DEATHS..... The number of reported fetal deaths in California increased 7.5 percent from 3,259 in 1986 to 3,504 in 1987 (Table 3-1).

The ratio of fetal deaths to 1,000 live births in California increased from 6.8 in 1986 to 7.0 in 1987.

The Black fetal death ratio increased to 12.8 in 1987 from 11.2 in 1986. The White fetal death ratio remained the same as in 1986, 6.4. Among mothers of Spanish/ Hispanic origin, the fetal death ratio fluctuated from 6.7 in 1986 to 6.8 in 1987 (Tables 2-9, 3-1).

In 1987, of the 3,504 reported fetal deaths in California, 2,508 (71.6 percent) were White (includes Hispanic), and 646 (18.4 percent) were Black (Table 3-1).

Of the 3,504 reported fetal deaths in 1987, 1,131 (32.3 percent) were to mothers of Spanish/Hispanic origin (Table 3-2).

In 1987, 11.3 percent of all reported fetal deaths in California were to women under 20 years of age; approximately one-half (51.5) were to women in their twenties; 21.0 percent were to women ages 30-34; 9.8 percent were to women ages 35-39; 3.0 percent were to women in their forties; there was only one fetal death to women ages 50 and over; and 3.3 percent were to women with age not stated (Table 3-4).

INFANT DEATHS..... California's infant death rate, after dropping to 8.9 in 1986, its lowest level ever, increased slightly to 9.0 in 1987. However, this rise was not statistically

INFANT DEATHS (continued).... significant. The number of infant deaths increased by 232, from 4,298 in 1986, to 4,530 (Table 4-1).

The neonatal death rate decreased slightly from 5.6 in 1986 to 5.5 in 1987. The postneonatal rate increased from 3.3 to 3.5 (Table 4-1).

The majority (61.1 percent) of California infants who died in 1987 were less than one month of age. Of the infants who died at less than one month of age, 45.7 percent died within 24 hours of birth (Table 4-2).

- Sex..... More than one-half (56.8 percent) of the 1987 infant deaths, in California, were males (Table 4-2). In 1986 males accounted for 56.7 percent of the infant deaths and in 1970, 57.4 percent.

- Cause of Death..... Congenital Anomalies were responsible for 21.5 percent of resident infant deaths in 1987, as compared to 23.0 percent in 1986 (Table 4-4).

Sudden Infant Death Syndrome (SIDS) was the cause of death for 661 resident infants in 1987, up from 651 deaths in 1986. The SIDS death rate of 130.9 per 100,000 live births was down 3.1 percent from the 1986 rate of 135.1 (Table 4-4).

"Certain Conditions Originating in the Perinatal Period" accounted for 44.2 percent of all resident infant deaths in 1987 (Table 4-4).

There were eight recorded AIDS-related deaths among resident infants in 1987 (Table 5-11).

DEATHS..... The crude death rate increased slightly from 7.5 per 1,000 population in 1986 to 7.6 in 1987. The number of deaths to California residents increased by 6,569 from 202,826 in 1986, to 209,395 in 1987, a 3.2 percent difference. The 1987 death rate was 757.0 per 100,000 population compared to 751.7 in 1986 (Tables 1-1 and 5-3).

- Sex..... California's male residents accounted for 52.6 percent of the 209,395 deaths; 47.4 percent of the total deaths were female (Table 5-4).

  As in 1986, the number of male deaths in California was greater than the number of female deaths in all age groups except 75 years and over. The male death rate was also higher than the female death rate in all age groups (Tables 5-4 and 5-3).

  The greatest gender differences in death rates were found among residents ages 15-24 and 25-44. Males ages 15-24 and 25-44 were respectively 3.2 and 2.6 times more likely to die in 1987 than were females of the same age (Table 5-3).

  The resident female death rate rose by 1.2 percent in 1987. Female death rates decreased in the 15-24, 45-64, and 65-74 age groups and rose in the remaining groups. The female death rates for under 1 and 5-14 year-olds increased by 4.1 and 5.1 percent respectively (Table 5-3).

  Resident males ages 5-74 experienced a decrease in death rates in 1987; however the under 1, 1-4, and 75 and over age groups posted increases of 4.7, 9.6, and 1.4 percent respectively (Table 5-3).

- **Age-Specific Death Rates**..... Death rates per 100,000 population increased from 751.7 in 1986 to 757.0 in 1987, a 0.7 percent difference. Death rates decreased in the age groups from 5-74 and increased at the extremes; under 1, 1-4, and 75 and over. The 1-4 year-old age group posted the largest increase, 5.8 percent, due largely to the 9.6 percent increase in the male death rate for this age group (Table 5-3).

- **Number and Percent of Deaths by Race/Ethnicity**..... Of the 209,395 California resident deaths in 1987, Whites numbered 184,213, Blacks 16,738, other race/ethnicities 8,192 and not stated 252. Whites accounted for 88.0 percent of total resident deaths, Blacks, 8.0 percent, Chinese 1.1 percent, Filipino 1.0 percent, Japanese 0.7 percent, Korean, Pacific Islander, Vietnamese 0.2 each, Other Asian 0.1 percent, Cambodian, Thai, and Other race/ethnicities less than 0.1 percent, and not stated 0.1 percent. There were 17,855 Spanish/Hispanic deaths comprising 8.5 percent of all California resident deaths. (Tables 5-4 and 5-5).

- **Leading Causes of Death**..... There were numerical increases in six of the ten leading causes of death from 1986 to 1987. Among them, "Pneumonia and Influenza" rose in California by 8.7 percent, "Diabetes Mellitus" by 8.4 percent and "Chronic Obstructive Pulmonary Disease and Allied Conditions" by 5.9 percent from 1986 to 1987. The three violent causes of death; "Unintentional Injuries", "Suicide" and "Homicide" posted decreases of 2.2, 2.3, and 4.5 percent respectively in 1987 (Table 5-1).

- Leading Causes of Death (continued)..... Four of the ten leading causes of death showed an increase in their rate from 1986 to 1987 . The "Pneumonia and Influenza" rate increased by 6.0 percent, "Diabetes Mellitus" by 5.7, "Chronic Obstructive Pulmonary Disease" by 3.3 and "Cerebrovascular Disease" by 1.7 percent. The rates for "Homicide", "Suicide", "Unintentional Injuries" and "Chronic Liver Disease and Cirrhosis", posted the largest percent decreases, 6.9, 4.7, 4.6, and 3.6 respectively. Although, "Heart Disease" -- the number one cause of death, increased numerically in 1987, the actual rate decreased by 0.6 percent (Table 5-1).

- Leading Causes of Death By Sex and Age..... "Unintentional Injuries" continued to be the leading cause of death in California for males ages 1-44 years and for females ages 1-34. "Malignant Neoplasms" was again the leading cause of death for females ages 35-74. "Diseases of the Heart" was the number one killer of males ages 45 and over, and females ages 75 and over. "Certain Conditions Originating in the Perinatal Period" continued as the leading cause of death for males and females under the age one year (Table 5-2).

  "Acquired Immune Deficiency Syndrome" (AIDS) was among the five leading causes of death by sex and age for the first time in 1987. AIDS was the second leading cause of death for males ages 25-44, it was fifth for males ages 15-24 and 45-54. (Due to new classification numbers, "Acquired Immune Deficiency Syndrome" (AIDS) mortality data are not strictly comparable with data for previous years. See Chapter 6, "HIV Code Changes") (Table 5-2).

- **Leading Causes of Death by Race/Ethnicity**..... Tables 5-1 A-D, "Ten Leading Causes of Death--White, Black, Hispanic, Asian and Other: California, 1986 and 1987" are new additions to the annual Vital Statistics of California report.

White..... The death rate for White residents increased by 1.3 percent from 1986 to 1987. Among this group there were rate decreases in three of the 10 leading causes of death: "Unintentional Injuries", 6.1 percent, "Suicide", 5.9 percent, and "Chronic Liver Disease and Cirrhosis", 4.7 percent. "Pneumonia and Influenza" posted the largest rate increase, 6.2 percent, followed by "Atherosclerosis", 6.1 percent, and "Diabetes Mellitus", 5.0 percent.

Black..... Among Black residents the death rate increased 3.4 percent from 1986 to 1987. This group experienced rate increases in seven of the ten leading causes of death. The categories to show a rate decrease were "Chronic Obstructive Pulmonary Disease", 3.6 percent, and "Malignant Neoplasms", 0.3 percent. The "Homicide" rate remained the same as 1986, 47.8 deaths per 100,000 population. "Diabetes Mellitus" posted the largest rate increase from 1986 to 1987, 16.0 percent, followed by "Pneumonia and Influenza", 14.6 percent, and "Cerebrovascular Disease", 8.4 percent.

Hispanic..... Among Hispanics the death rate increased by 1.3 percent from 1986 to 1987. There were rate decreases in four of the ten leading causes of death. "Homicide", 5.9 percent, "Unintentional Injuries", 3.4 percent, "Malignant Neoplasms", 1.2 percent, "Cerebrovascular Disease",

- **Leading Causes of Death by Race/Ethnicity; Hispanic (continued).....** 0.4. The largest rate increases were "Pneumonia and Influenza", 12.2 percent, Diabetes Mellitus", 9.4 percent, and "Congenital Anomalies", 9.1.

  Asian and Other.... The death rate for Asian and Other residents increased 3.3 percent from 1986 to 1987. "Chronic Obstructive Pulmonary Disease and Allied Conditions" posted the largest rate increase of 18.2 percent, followed by "Certain Conditions Originating in the Perinatal Period", 17.9 percent, and "Pneumonia and Influenza", 8.6 percent. "Homicide" fell from 10th to 11th place among the leading causes of death. The homicide rate decreased by 25.0 percent from 1986 to 1987 followed by decreases in "Chronic Liver Disease and Cirrhosis", 7.4 percent, and "Diabetes Mellitus", 5.8 percent.

- **Leading Causes of Death by Sex, Age and Race/Ethnicity.....** Tables 5-2 A-D, "Five Leading Causes of Death By Sex and Age for White, Black, Hispanic, and Asian and Other, California, 1987" are new to the annual Vital Statistics of California report.

  White..... The category of "Unintentional Injuries" was the leading cause of death for White males ages 1-44 and females ages 1-34. "Malignant Neoplasms" was the leading cause of death for White females ages 35-74. "Diseases of the Heart" was the number one killer of White males ages 45 and over. "Certain Conditions Originating in the Perinatal Period" was the leading cause of death for White males and females under the age of one year.

- **Leading Causes of Death by Sex, Age and Race/ Ethnicity; White (continued).....** "Acquired Immune Deficiency Syndrome" was the second leading cause of death for White males ages 25-44. It ranked fourth among White males ages 45-54 and fifth for 15-24 year-old White males.

  Black..... "Unintentional Injuries" were the leading cause of death for Black males and females ages 1-14. "Homicide" was the number one killer of Black males and females ages 15-34. "Malignant Neoplasms" was the leading cause of death for Black females ages 35-54.

  "Diseases of the Heart" was the leading cause of death for Black males ages 35 and over, and Black females ages 55 and over. "Certain Conditions Originating in the Perinatal Period" was the leading cause of death for Black males and females under the age of one year.

  "Acquired Immune Deficiency Syndrome" was the third leading cause of death for Black males ages 25-44. It ranked fourth for Black males ages 15-24.

  Hispanic..... Among Hispanics, "Unintentional Injuries" were the leading cause of death for males ages 1-44 and females ages 1-34. "Malignant Neoplasms" was the leading cause of death for females ages 35-64. "Diseases of the Heart" was the leading cause of death for Hispanic men ages 45 and over, and females ages 65 and over. "Certain Conditions Originating in the Perinatal Period" was the leading cause of death for Hispanic males and females under one year.

- **Leading Causes of Death by Sex, Age and Race/ Ethnicity; Hispanic (continued).....** "Acquired Immune Deficiency Syndrome" was the third leading cause of death for Hispanic males ages 25-44.

  Asian and Other.... In 1987 "Unintentional Injuries" were the leading cause of death for Asian and Other males ages 1-34 and for females ages 1-24. "Malignant Neoplasms" were the leading cause of death for Asian and Other females ages 25-74 and for males ages 35-64. "Diseases of the Heart" was the number one killer of "Asian and Other" men ages 65 and over, and females ages 75 and over. "Certain Conditions Originating in the Perinatal Period" was the leading cause of death for Asian and Other males and females under the age of one year.

  "Acquired Immune Deficiency Syndrome" was the fifth leading cause of death for "Asian and Other" males ages 35-44.

- **Deaths from AIDS.....** There were 2,651 deaths to California residents from Acquired Immune Deficiency Syndrome in 1987. (Table 5-11).

  In 1987, 96.4 percent of AIDS deaths were to males and 3.6 were to females. White males accounted for 2,197 or 82.9 percent of the 2,651 AIDS deaths, followed by Black males with 11.8 percent of the total. White females comprised 2.5 percent and Black females 0.9 percent of the total (Table 5-12).

  Among the 58 counties, Los Angeles posted 1,070 or 40.4 percent of the 2,651 AIDS deaths which occurred to California residents in 1987. San Francisco accounted for 668 or 25.2 percent, followed by San Diego with 147 or 5.5 percent (Table 5-12).

- **Malignant Neoplasms Death Rates** ..... There was a slight decrease in the death rate for cancer by all sites in California, from 172.0 per 100,000 population in 1986 to 171.2 in 1987. Inyo County posted the highest cancer death rate among the counties, 333.3 followed by Lake with 309.0. Mono County's cancer death rate was the lowest at 108.7, followed by Kings with 119.5 (Table 5-13).

  Among California residents the cancer death rate was highest for cancer of the "Trachea, Bronchus and Lung", 45.7 per 100,000 population, followed by "Other Digestive Organs and Peritoneum", 37.0. The lowest cancer death rate was for "Hodgekin's Disease", 0.6 (Table 5-13).

1. REVIEW OF VITAL STATISTICS OF CALIFORNIA

a Rates and ratios are not calculated for fewer than five events.
b Fetal death ratios and infant death rates are not calculated for counties reporting fewer than 1,000 births.

Note: Infant death rates and fetal death ratios are per 1,000 live births.
Death and live birth rates are per 1,000 estimated population.
Maternal deaths are those due to complications of pregnancy, childbirth, and the puerperium, Ninth Revision International Classification of Diseases 630–676. Infant deaths are those under one year. Neonatal deaths are those under 28 days. Fetal deaths of 20 weeks or more gestation are required by law to be registered.

1 The general fertility rate is the total number of live births, regardless of age of mother, per 1,000 women of childbearing age (15–44 years).

2 The total fertility rate is the sum of each age-specific live birth rate multiplied by the number of years in the age group (five years in this case).

3 An age-specific live birth rate is the number of live births per 1,000 women in a specific age group. For women under 15, the rate is calculated using the female population 10–14 years of age, and for women over 44, using the female population 45–49 years of age.

a Based on 100 percent of births in selected states and on a 50 percent sample of births in all other states.
b Based on a 50 percent sample of births.

1 The general fertility rate is the total number of live births, regardless of age of mother, per 1,000 women of childbearing age (15–44 years).

a Based on 100 percent of births in selected states and on a 50 percent sample of births in all other states.
b Based on a 50 percent sample of births.

Note: Live births with unknown birth order were distributed proportionally to live births with known birth order, before rates were calculated.

Rates are per 1,000 women aged 15–44 years.

1 The general fertility rate is the total number of live births, regardless of age of mother, per 1,000 women of childbearing age (15–44 years).

a Represents a rate more than zero but less than 0.05.

– Represents zero events.

Note: Live births with unknown birth order were distributed proportionally to live births with known birth order, before rates were calculated.

Rates are per 1,000 women in a specified age group. For women under 15, the rate is calculated using the female population 10–14 years of age, and for women over 44, using the female population 45–49 years of age.

1 An age-specific live birth rate is the number of live births per 1,000 women in a specific age group.

a- Rates not calculated for fewer than five live births.

– Represents zero births.

Source: *1987 Population Projections for California Counties, Baseline 86,* February 1988. Baseline 86 projections have been controlled to reflect the latest Department of Finance population estimates (Report 87 E-2).

Female	1,322	57	73	9	22	6	10	1,067	84	4

1 All live births with at least one type of congenital anomaly.

2 Each type of congenital anomaly contains only those births with that anomaly.

3 See page 259 for definitions of congenital anomaly codes.

4 Birth records with "unknown congenital anomalies" include those that do not state whether or not there are congenital anomalies.

Note: Congenital anomalies which were not detected at the time of birth are not included in this table. A recent study of five counties indicated that 15.7 percent of congenital anomalies were reported on the California birth certificate. For further detail *see Evaluation of Hospital Discharge Index and Birth Records*, California Birth Defects Monitoring Program, Department of Health Services.
